

Appendix B: TTI line keywords

The TTI line is a string of ASCII characters that are left justified at the top of each page. The characters are copied to the page without conversion, with the exception of the following special formatting keywords:

%d day of the month (ranging from 01–31)

%m month of the year (ranging from 01–12)

%Y four-digit year (for example, 1994)

%y two-digit year (only last two digits)

%T time, in 12-hour AM/PM notation (for example, 11:04 p.m.)

%t time, in 24-hour notation

%z timezone (for example, EDT)

%p current page in the fax file (three digits zero-filled)

%n total number of pages in the fax file (three digits zero-filled)

%C clock symbol

%D calendar symbol

%E telephone symbol

%P page symbol

%% percent symbol

The following formats are combinations of these keywords to accommodate the 31-character string limit of the XAE:

%f1: %d.%m.%Y combination date format

%f2: %d-%m-%Y combination date format

%f3: %d/%m/%Y combination date format

%f4: %m.%d.%Y combination date format

%f5: %m-%d-%Y combination date format

%f6: %m/%d/%Y combination date format

%f7: %Y.%m.%d combination date format

%f8: %Y-%m-%d combination date format

%f9: %Y/%m/%d combination date format

%f10: %p/%n combination page count

The default TTI line, shown in the following example, occupies a total of 29 characters.

Example

%C %t %z %P %f10 %D %f9

Using the combination formats in a typical TTI line would leave space for an additional six characters of information.

Action

*** 15:42 EDT * 001/006 * 96/05/14**

The asterisks “*” are replaced by the trimtab clock, page, and calendar symbols in this example.
